

# Strengthen Your Human Firewall in 6 Steps

Use this step-by-step framework to put your human firewall strategy into motion, starting with where your current program falls short.

## Step 1: Conduct a Training Gap Analysis

Audit your current security awareness program. Identify where AI-specific threats, deepfakes, AI phishing, and synthetic voice fraud are absent from your curriculum. CampusGuard's [security awareness training](#) covers AI security and managing AI security risks, so your employees are up to date on the latest threats.

## Step 2: Define Your AI Threat Scenarios

Work with your security team to document the AI-based attack scenarios most relevant to your organization. Consider your sector (i.e., higher education), your highest-risk roles (finance, IT, HR, executive assistants), and your existing vulnerabilities.

## Step 3: Update or Rebuild Your Training Content

Develop or source training modules that specifically address AI-generated threats. Prioritize content that is scenario-based, visually rich, and updated regularly. Partner with a cybersecurity awareness provider, like CampusGuard, who is experienced in higher education.

## Step 4: Launch a Phased Awareness Campaign

Roll out AI-focused awareness content in phases, starting with the highest-risk departments. Use a mix of formats: short videos, simulated attacks, and job aids (e.g., a quick-reference card for verifying suspicious requests).

## Step 5: Establish a Clear Reporting Protocol

Ensure every employee knows exactly how to report a suspected AI-generated attack. Make the process frictionless, one click, one number, one email. Track reports and share anonymized outcomes to reinforce the value of reporting.

## Step 6: Measure, Adjust, and Repeat

Set baseline metrics before your campaign launches: click rates on simulated phishing, report rates, and training completion. Measure again after each training cycle. Use the data to refine your approach and demonstrate program value to leadership.
