

# Verified Credentials

As stolen passwords and identity fraud surge, traditional authentication can no longer keep up. Ditch the passwords. Drop the custom code. Our verifiable credentials platform gives your organization everything it needs to issue, verify, and manage digital identities, and extend trusted access to employees, customers, partners, and citizens alike.

## Solutions to Help You Operate Verified Credentials

### Verifiable Credential Issuance

Create and issue secure, tamper-proof digital credentials that users carry in their identity wallet and present on demand.

### Identity Verification & Authentication

Replace passwords and OTP codes with trusted digital credentials. Users verify who they are once and move seamlessly across applications, facilities, and services.

### Compliance & Eligibility Validation

Instantly validate training completions, employment eligibility, licenses, and regulatory requirements without manual checks or delays.

### Access & Authorization Orchestration

Control access to systems and spaces based on verified signals like role, certification, or organizational affiliation.

### Integration & Identity Orchestration

Drop into the workflows you already rely on, HR, onboarding, visitor management, and app login, without custom development. Our platform connects and orchestrates identity across your entire stack.

### Audit, Reporting & Governance

Maintain a complete audit trail of credential activity, verification events, and access history to support compliance and security oversight.

## Why Verified Credentials Are Essential

Attackers don't break in. They log in. Verified credentials replace the passwords and shared secrets that make that possible, shutting down phishing attacks before they start.
